

Networking Basics

Networking Basics

- Network Topologies
- Different types of Devices
- Types of ports, types of connections
- Understanding a network diagram
- DNS, NTP, HTTP, Wireshark

Lab

- Create a virtual network with Packet tracer
- Ping machines across networks
- Capture packets with Wireshark and ensure that you get the password

Network Topologies

- A network topology is the arrangement of devices (**nodes**) and connections (**links**) in a computer network.
- It shows how computers, servers, and other devices are connected and how data flows between them.
- There are two main types of topology:
 - **Physical Topology:**
 - The actual physical layout of cables and devices.
 - **Logical Topology:**
 - How data moves across the network, regardless of physical layout.

Network Topologies

Various networking topologies:

- Point To Point Topology
- Mesh Topology
- Star Topology
- Bus Topology
- Ring Topology
- Tree Topology
- Hybrid Topology

Point To Point Topology

- Point-to-point topology is a type of topology that works on the functionality of the sender and receiver.
- It is the simplest communication between two nodes, in which one is the sender and the other one is the receiver.
- Point-to-Point provides high bandwidth.

Mesh Topology

- In a mesh topology, every device is connected to another device via a particular channel. Every device is connected to another via dedicated channels.
- These channels are known as links.
- Communication is very fast between the nodes. Mesh Topology is robust.
- The fault is diagnosed easily. Data is reliable because data is transferred among the devices through dedicated channels or links.
- Provides security and privacy.

Star Topology

- In Star Topology, all the devices are connected to a single hub through a cable.
- This hub is the central node and all other nodes are connected to the central node.
- The hub can be passive in nature i.e., not an intelligent hub such as broadcasting devices, at the same time the hub can be intelligent known as an active hub.
- Active hubs have repeaters in them.

Bus Topology

- Bus Topology is a network type in which every computer and network device is connected to a single cable.
- It is bi-directional. It is a multi-point connection and a non-robust topology because if the backbone fails the topology crashes.
- If N devices are connected to each other in a bus topology, then the number of cables required to connect them is 1, known as backbone cable, and N drop lines are required.
- Coaxial or twisted pair cables are mainly used in bus-based networks that support up to 10 Mbps.

Ring Topology

- It forms a ring connecting devices with exactly two neighboring devices.
- A number of repeaters are used for Ring topology with a large number of nodes, because if someone wants to send some data to the last node in the ring topology with 100 nodes, then the data will have to pass through 99 nodes to reach the 100th node.
- In-Ring Topology, the Token Ring Passing protocol is used by the workstations to transmit the data where, Token passing is a network access method in which a token is passed from one node to another node & Token is a frame that circulates around the network.

Tree Topology

- Tree topology is the variation of the Star topology. This topology has a hierarchical flow of data.
- It allows more devices to be attached to a single central hub thus it decreases the distance that is traveled by the signal to come to the devices.
- It allows the network to get isolated and also prioritize from different computers.
- We can add new devices to the existing network.

Hybrid Topology

- Hybrid Topology is the combination of all the various types of topologies we have studied above.
- Hybrid Topology is used when the nodes are free to take any form.
- It means these can be individuals such as Ring or Star topology or can be a combination of various types of topologies seen above.

Start the packet analysis using Wireshark

After logging in, stop capturing the traffic.

Analyze the captured packets

The image shows the Wireshark network protocol analyzer interface. The main packet list on the left contains 59 entries, with the filter 'tcp.stream eq 0' applied. The packet details pane on the right shows the selected packet (No. 48) with its protocol stack: TCP, TELNET, and TELNET. The 'Follow' menu is open, showing options to follow various protocols, with 'TCP Stream' selected.
