

Step 1 – Create a Word Document via PowerShell

```
$word = New-Object -ComObject Word.Application
$word.Visible = $true
$doc = $word.Documents.Add()
$doc.SaveAs("C:\Temp\Test.docm", 13) # 13 = Macro-enabled document
$doc.Close()
$word.Quit()
```

Step 2 – Add Macro That Spawns PowerShell

You must manually insert this macro into the .docm file:

1. Open the document.
2. Press ALT + F11
3. Insert → Module
4. Add:

```
Sub AutoOpen()
    Shell "powershell.exe -NoProfile -ExecutionPolicy Bypass -Command ""Start-Process notepad""
End Sub
```

This makes:

WINWORD.EXE → powershell.exe → notepad.exe

You can verify using:

Get-CimInstance Win32_Process | Select Name, ProcessId, ParentProcessId
