

Graded Project 1

1. Install and configure a new windows server 2022 using the hostname as “member2” and must be domain joined to existing domain controller machine. Create a new user called “Wipro admin” with administrator-level privileges and login to member2 and verify. Use this member2 machine and connect to the existing linux machine using SSH and check the logged-in user name.
2. On DC machine, use PowerShell ISE to run the following cmdlets and take the screenshot of all cmdlets individually.
 - a. Cmdlet to list current data and time.
 - b. Cmdlet to list all processes.
 - c. Cmdlet to display logged in user name.
 - d. Display IP address using PowerShell cmdlet (not cmd prompt command).
 - e. Use PowerShell cmdlet to test if you are connected to internet or not.
3. Use linux machine to scan for all the active machine within same network.
4. Use appropriate commands on linux to list DNS and domain information of “Wipro.com” & “rpsconsulting.in”.
5. Use CyberChef to generate public and private key using RSA key pair.
6. Use 2nd linux server (create/clone if you don't have another linux machine) and download Ubuntu:22.04 container on top of it.
7. Configure NAT for the following architecture:

Use the following IP and subnet mask only.

- ✓ 1st PC – IP = 192.168.1.10/24
 - ✓ 2nd PC – IP = 192.168.1.20/24
 - ✓ Router interface G0/0 = 192.168.1.1/24
 - ✓ Router interface G0/1 = 203.0.113.1/24
 - ✓ Server – IP = 203.0.113.10/24
8. On 2nd linux server, create firewall rule to allow the following and verify using appropriate commands:
 - a. Ports: 80, 22, 53
 - b. Services: ntp, samba
 9. Use Palo-Alto firewall and create a policy to block the following websites using the web browser:
 - a. Facebook
 - b. YouTube
 10. Use azure calculator to calculate the cost (in INR only) for the existing setup within your VMWare environment.
